Good afternoon. Location S2A-SS1 was a sub-slab port that was installed during the June 2011 mobilization, and was called S2-I01 during that mobilization. It is located in the rear of the drycleaners, close to the apartment. We attached a SUMMA canister to the sub-slab port during the February 2012 mobilization, but didn't get a sample out of it as the port must have been blocked. Therefore, there is no analytical data associated with that location and I apologize for including it on the map.

Thanks,
Mike

I'm certain that we did not collect a SS in the apt, but one of the SS cans in the cleaners was close to the apt. Correct Mike?

Jeff

Elena/Jill:

Potential Source #3 is a former dry cleaner.

About re-sampling or monitoring... The HC recommendation is to broad.... the 1st HC stressed out the importance of sampling during rainy seasons. Can we re-sample during the the next rainy season -usually July thru Nov? and when do we stop re-sampling?

Jeff

We need clarification on one sample collected In Feb. the apartment behind the former Serrano Dry Cleaners. It seems that one of the Figures shows a SS sample collected in the apt., but the Excel spreadsheet has no sample results associated to that SS sample.

Could you please find out if we collected a SS in that apartment? and if we did, find out what happened with the SS results at that location?

thanks

Denise
